CartScope

Alpha 0.1.1 submission

Our shopping project keeps products from different stores in one Chrome side panel. The released Alpha covers captured and manually entered offers, a saved cart, a budget, observed alerts, order notes and payment arithmetic.

The UniCart prototype guided saving, cart and comparison. Our design uses paper and forest colors, a custom CartScope mark and compact cost records. Real Chrome screenshots show the finished screens.

Deliverable	Where to find it

Completion status

The Alpha runtime and its release publication are complete for the documented scope. Ten consenting reference users, invitation delivery and collected feedback remain pending. Live retailer discovery, unattended checks and carrier synchronization are planned work.

Recorded automated evidence: 65 passing Node tests (including 12 DOM flow checks), plus 16 passing Chrome checks. These are test counts, not reference users.

Install and use the Alpha

Use the packaged extension for page capture, or open the hosted demo to explore the same interface with examples.

Installation

1. Download cartscope-alpha-0.1.1.zip from the release page and unzip it into a folder you will keep.

2. Open chrome://extensions, enable Developer mode, and choose Load unpacked.

3. Select the folder containing manifest.json directly. Pin CartScope from the Extensions menu.

4. Open a product page, click the CartScope toolbar icon, then choose Capture this page and review before saving.

Chrome 116 or newer is required. Keep the folder in place; remove the extension from chrome://extensions when finished. No AWS account is needed.

A short demonstration

1. Save an item and correct any missing product or variant details. Add another store's product, change quantity and set a budget.

2. Add a checked offer for the same model, color, size and condition. Compare shipping, estimated tax, membership, discounts and eligible cashback. Switch ranking preferences.

3. Enable a price or restock watch. Capture or update the same offer again to record a new observation and detect a qualifying change.

4. Enter an order after retailer checkout, update its status and add a safe tracking link.

5. Enter payment terms to see total owed and the installment schedule. Export a backup and restore it in Settings.

Data and samples

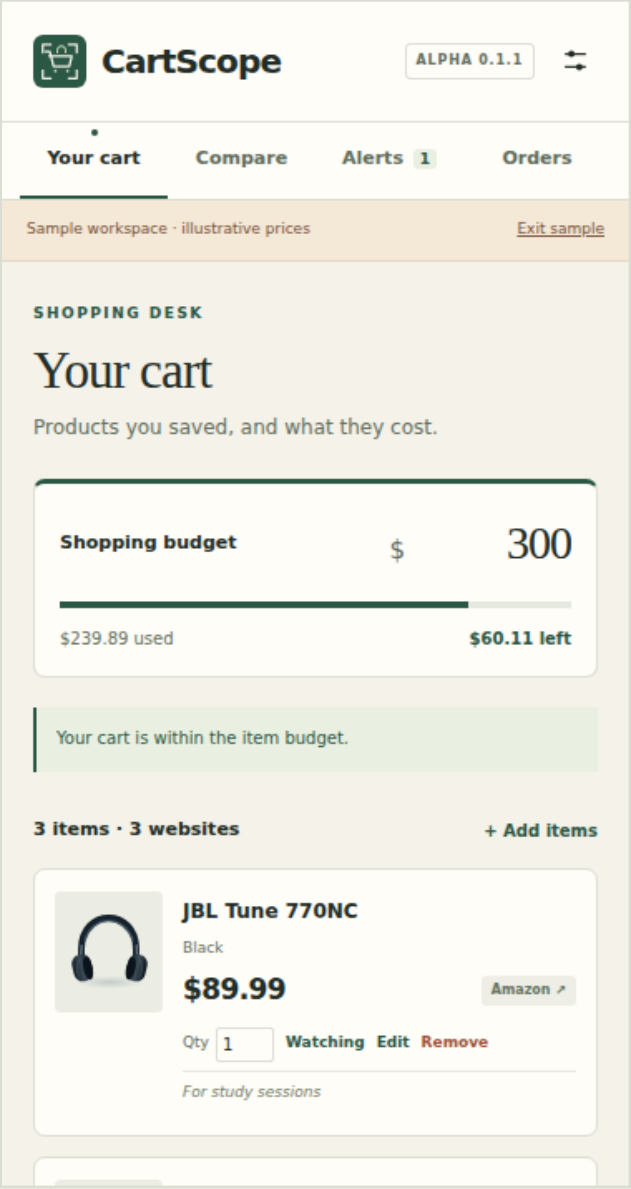

Real installations start empty. Optional sample prices, stock and orders are labeled and isolated. The browser demo uses its own local storage; capture and Chrome notifications require the extension. The cart covers item prices, while Compare shows estimated complete costs. Retailer checkout sets final charges.

Shopping records stay on the device. Product images and shopping links contact their source sites normally. Backups contain products, notes and order records. Public feedback should omit contact, payment and private order information.

Walkthrough in Chrome

Cart and comparison screens from the recorded run, using labeled sample data. These excerpts show the cart and compared offer costs; full images are linked.

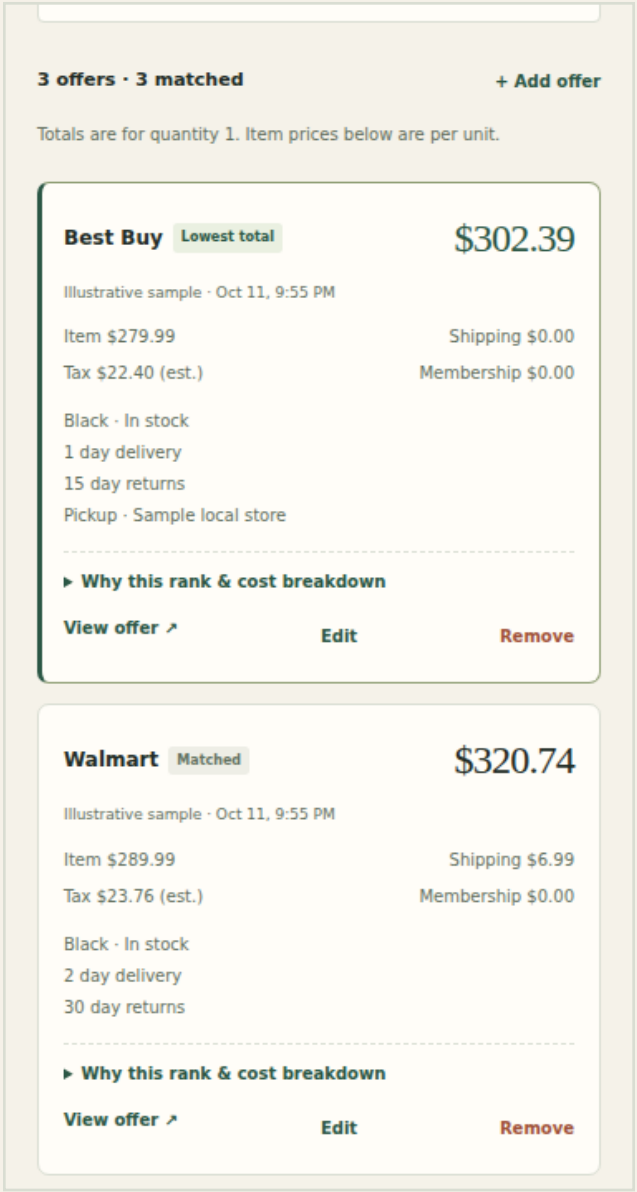

Saved cart and budget

Products from several stores, quantities, save-for-later and an item-price budget.

Open full screenshot

Checked offer comparison

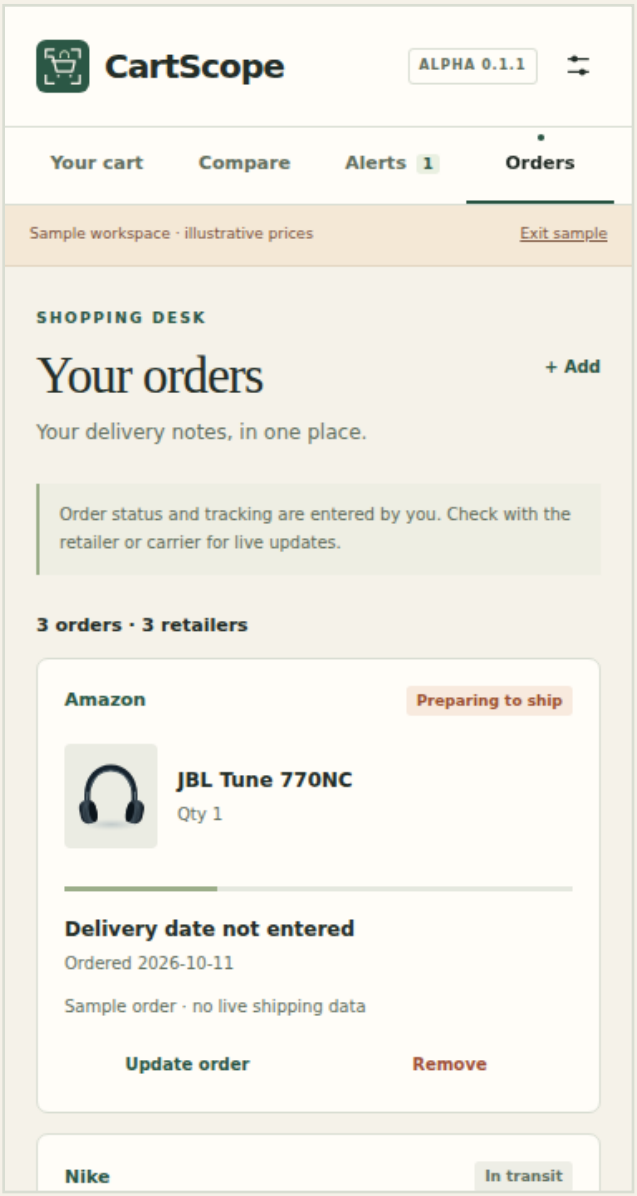

Matched offers with price, shipping, tax, membership and retailer terms. Missing required costs stay unknown.

Open full screenshot

Orders and payment arithmetic

These views keep user-entered information together. They do not imply live carrier data or a financing-provider offer.

Order notes and status

Manual statuses, dates and tracking details. The retailer or carrier remains the source of delivery updates.

Open full screenshot

Whole payment obligation

Calculated total and exact-cent schedule from entered terms. Confirm the actual provider contract.

Feature-to-test evidence

Each row ties a working Alpha feature to the checks that exercised it. The detailed reports name every recorded check.

Feature	Implemented behavior	Evidence
1. Product capture and review	Read the active product page, edit the result, and save it.	Extraction fixtures + Chrome toolbar capture; category pages rejected.
2. Cart and budget	Products from several stores, quantities, notes, save-for-later, budget and retailer links.	Chrome add/edit/quantity checks; persistence through real extension storage.
3. Offer comparison	Model, variant and condition checks; full cost components; total, delivery, pickup and return ranking.	Core arithmetic/identity tests + Chrome mismatch and unknown-shipping checks.
4. History and alerts	Timestamped observations, opted-in drop/restock watches, in-app notifications.	Chrome observation transitions; repeat captures or edits, not background polling.
5. Order records	Manual order creation, dates, status, notes and safe tracking links.	Chrome create/update flow; storage rejects invalid quantities and dates.
6. Payment calculator	Full obligation, entered interest/fees, due dates and exact-cent installments.	Core rounding/leap-day tests + Chrome full-total and remainder checks.
7. Data controls	Export/import/delete, atomic validation, separate real and sample workspaces.	Chrome backup round trip; storage failure and sample-provenance regressions.
8. Browser demo and layout	The same app in browser storage, sample mode, responsive screens.	Chrome preview persistence/isolation, narrow layouts and hosted demo checks.

How the browser test ran

The actual release ZIP was unpacked into a clean directory and loaded in a disposable Chrome for Testing 151.0.7922.34 profile. The test used the real service worker, extension storage, toolbar action, scripting and downloads. Capture failed before the toolbar grant, then read a served HTTP product fixture after the click. A category fixture was rejected.

The fixture pages are reproducible retailer-shaped examples. They do not validate current markup on every live store, native desktop alert delivery, or testers' operating systems. The hosted demo check is recorded separately in the same Chrome report.

Node checks include cost, matching, extraction, storage, ZIP packaging, and publishing contracts. Happy DOM runs the actual app event handlers; publisher tests use disposable CLI doubles.

Verification record | Chrome checks | DOM checks | Workflow run

Feedback and remaining work

The invitation and collection mechanisms are ready. Actual participation and delivery are still pending.

Reference-user feedback

Assign one private participant to each R01-R10 ID. Personalize the draft invitation with the recipient, ID and deadline, then send it individually through the team's authorized email account. Record actual invitation and response dates; keep contacts and delivery evidence private.

The Alpha feedback form or a private email reply collects task success/failure, time taken, 1-5 ease/clarity/usefulness/confidence ratings, confusing steps, missing information and the next improvement. Testers identify installed-extension or browser-demo mode; skipped capture/installation tasks are recorded as not attempted.

Email draft | Feedback form | Task protocol | Reference roster

Tracker and next sprint

The tracker contains 31 records, including 5 next-sprint stories and 5 later backlog stories. The linked board records current implementation, publication and user-work statuses. Recruitment, invitation delivery and feedback remain pending.

Next priorities are current-store capture validation, an authorized cross-store source, and fixes from actual feedback. Unattended price checks and order imports depend on permitted source access. Optional accounts, hosted refreshes, provider-backed BNPL, broader accessibility testing and Chrome Web Store distribution remain backlog work.

Release evidence snapshot

Runtime 0.1.1; Chrome-tested ZIP 0.1.1; run completed October 11, 2026. Browser 151.0.7922.34. Source links and the named test list are in the Markdown companion.

ZIP SHA-256: 081cb251510193a73e1d51c0caf004ee310ae6ef77d927e26e93ca92432a60d0

Reproduce: npm ci; npm run validate; npm test; npm run package; npx playwright install chromium; PUBLIC_DEMO_URL=https://qarteu.github.io/cartscope/ npm run test:browser.

The Alpha does not automatically discover every store's offer, poll prices while the user is away, import shipments, process payments, or synchronize accounts. No ten-user invitation or usability outcome is claimed.
